

SonarQube report

Notes App, scanned on 28 August 2026 at commit 8bc1f76. Run locally with SonarQube Community 26.8 in Docker. Steps to reproduce are in README.md next to this file.

Quality gate: passed

Condition	Value	Required
Coverage on new code	91.2%	80% or more
Duplicated lines on new code	0.0%	under 3%
New issues	0	0

Results

Measure	Value
Bugs	0
Vulnerabilities	0
Security hotspots	0
Code smells	26
Reliability	A
Security	A
Maintainability	A
Coverage	77.9%
Duplication	0.0%
Lines of code	3847
Tests	241, all passing
Technical debt	1.5 hours

Coverage

Project	Tests	Lines covered
Backend	152	94.8%
Frontend	89	54.4%
Whole project	241	81.0%

Backend coverage comes from c8 over the unit and integration suites, and the integration tests run against a real PostgreSQL. Frontend coverage comes from Jest. The frontend number is the weak spot. The note editor, the shared note page and the profile page still have no tests.

What was fixed

The first scan did not pass. Coverage on new code was 56.7% against a threshold of 80%, and there were 16 new issues.

Four Jest suites were added for the notes page, the overview page, the transfer buttons and the app shell. Frontend coverage went from 27.1% to 54.4% and coverage on new code to 91.2%.

All 16 new issues were fixed. Most were small: `replaceAll` instead of `replace`, a `TypeError` instead of a plain `Error`, two nested template literals. The rest were regular expressions that backtrack badly on long input, in the HTML to Markdown conversion and the import parser. Those were rewritten as single pass helpers.

Two other things were cleared along the way. Eight uses of React's deprecated `FormEvent` type, and the only critical issue, a cognitive complexity of 18 in `NotesPage` against a limit of 15.

Code smells went from 62 to 26 and the debt from 8.2 hours to 1.5.

Remaining issues

All 26 are maintainability smells and none of them are in new code, so the gate is not affected.

Count	Rule
10	Use a more specific chai assertion
8	Mark React props as read only
4	Prefer an HTML tag over an ARIA role
4	Four unrelated single issues

One of the ARIA ones is arguable. `NoteCard` puts `role="button"` on the delete control because the card itself is already a button, and a button inside a button is not valid HTML.

Notes

The first attempt used the `sonarqube:lts-community` image. Its bundled TypeScript could not read the frontend `tsconfig`, so it skipped the whole React source and reported 1020 lines instead of 3847. The current `sonarqube:community` image reads it correctly. Worth knowing before reproducing this with the LTS tag.
